In designing aids for a child, we need to think not only about her type and amount of disability, but also the stage of progress she is at. For learning to walk, she may progress through a series of stages and aids. Here is an example:

1. Parallel bars
2. Wheeled walker
3. Crutches modified to form walker
4. Underarm crutches
5. Below elbow crutches
6. Cane with wide base
7. Walking stick (cane)
8. If possible, no aids at all

In this chapter we show a variety of aids for walking. Most can be made easily out of tree branches or wood. Some can be made from building construction bars (reinforcing rod) or metal tubing, and may require welding.

We include these ideas not to ask you to copy them, but with the hope that they will 'trigger' your imagination. Take ideas from these designs, and use the materials you have at hand. When possible, make your aids to meet the needs of the individual child.

At a village rehabilitation center, it helps to have a wide selection of aids on hand, so that you can try different ones on a particular child to find out what works and what she likes best.
Parallel bars

Simple designs for outdoor parallel bars, both adjustable and non-adjustable, are included in Chapter 46 on playgrounds, p. 417 and 425. On p. 417 we also give suggestions for adjusting the bar height to meet the needs of the individual child. The designs shown are:

OUTDOOR BARS

- Simple, non-adjustable bars (bamboo, wood, or metal)
- Bars with a leg separator for a child whose knees pull together
- 2 designs for bars with adjustable height

INDOOR BARS (design details for two of several models)

- Wood or metal pole
- Metal pipe (or try bamboo!)
- Tube metal or wood pole
- Triangular wood supports (best if bolted)
- Slanted edge to help prevent tripping
- Angle irons

ADJUSTABLE MODEL

ADJUSTABLE WIDTH AND HEIGHT

Designs from Functional Aids for the Multiply Handicapped

NON-ADJUSTABLE MODEL

NON-ADJUSTABLE BARS

WITH FOOT DIVIDER

Designs from Poliomyelitis, Huckstep.

This pipe slides in and out of this one.

Walkers

There are many ways to make walkers or walking frames. Here we show a range from very simple to more complex. Choose the design and height depending on the child’s needs and size.

Julio has strong arms and good body control. He can use a simple low walker.

Lico has weak elbows and poor balance or body control. He needs a higher walker with armrests.

Anna has weak legs and poor balance. She does best with underarm crutches built into the walker.

The above walkers can be made with 2 cm. x 4 cm. boards (such as those used on roofs to hold tiles), or thin trees or branches. The wood or plywood wheels roll easily when little weight is on them (when child pushes walker) but have a braking action when child puts full weight on them (when taking a step).

Finding the design that works best for a particular child often involves experimenting and changing different features.

For example, Carlota has poor body and hip control, and tends to ‘fall through’ the space between her arms when the handgrips are upright.

A higher walker with a bar as the handgrip works better for her.

These walkers can be made out of welded or bolted metal tubing.

This walker with slanting bars lets a child hold it at the height that he finds works best.
Other walker designs

**WALKER MADE FROM CANE, RATTAN, OR BAMBOO**

Design from Rattan and Bamboo Equipment For Handicapped Children, J. K. Hutt.

A walker with no wheels is very stable but harder to move.

A walker with 2 wheels and 2 posts is fairly stable but easy to move.

A walker with 3 or 4 wheels is very easy to move but can easily roll out from under the child (unless the child is seated).

**WOOD WALKER**

Design by Don Caston.

Wood walker for a child whose legs need to be held apart.

**WALKER MADE FROM SOLID IRON ROD (RE-BAR) WITH ARMRESTS—WELDING REQUIRED**

Design from Simple Prosthesis Manufacture, Chris Dartnell.

Measure child.

Cut and bend rod.

Assemble walker.

**SIMPLE WALKER MADE FROM SOLID IRON ROD (RE-BAR)—WELDING REQUIRED**

Design from Simple Prosthesis Manufacture, Chris Dartnell.

Cut and weld rod.

CART WALKERS

The added weight in the cart can help the child stand firmly—and makes learning to walk more fun. As the child progresses, he can change his grip from the front bar to the side bars.

WHEELS ON THIS CART WALKER ARE MADE FROM THE ROUND SEED PODS OF A TREE IN MEXICO, CALLED HAVA DE SAN IGNACIO.

ROLLEr SEAT AND TRICYCLE WALKERS

Useful for a child with cerebral palsy who ‘bunny hops’ (crawls pulling both legs forward together). Seat holds legs apart. The ‘chimney’ helps child keep his arms up and apart.

WALKERS FOR SITTING AND STANDING

SPIDER WALKER

Useful for the small child severely affected by cerebral palsy.

SADDLE-TYPE WALKER

Design from UPKARAN Manual (See p. 642.)

CAUTION: Sitting walkers should usually be used, if at all, as an early and temporary step toward walking. With them, the child does not learn to balance well and the hips are often at an angle which can form contractures (see Chapter 8, p. 86).
Crutches

MEASUREMENTS FOR UNDERARM CRUTCH

Top of crutch should be 3 fingers' width below armpit, so it does not press under the arms.

Elbow should be bent a little so that arms can lift body when walking.

Handgrip should be placed for comfort—usually about 1/3 of the way down crutch.

WARNING: Bearing weight under the arms like this can cause nerve damage that in time can lead to numbness and even paralysis of the hands.

Teach the child to put weight on her hands, not on her armpits.

One good way to make sure the child does not hang on the crutches with her armpits is to use elbow crutches like this.

There are many designs for underarm crutches. Here we show a few.

CRUTCHES FROM TREE BRANCHES, padded with wild kapok

These single support designs using tree branches are not as strong as the double support design shown at left.
WOODEN CRUTCHES

- Dowel 2½ cm. to 3½ cm.
- 2½ cm. if hard wood
- 3 cm. if soft wood
- Padded top
- Piece of rubber
- Woods screws

METAL CRUTCH

- Wood pole
- 1/4 inch to 5/8 inch (6.5 mm. to 1.6 cm.) steel rod or ‘re-bar’
- Weld metal washers to rod.
- Drill holes
- Metal strip
- Piece of tire

ADJUSTABLE WOOD CRUTCH

- Standard rubber crutch tip
- Bolts with wing nuts
- Handgrip adjusts by putting bolt through higher or lower holes.
- Sponge rubber padding
- Wing nut
- Thin bolt
- Washers
- Side view showing holes for height adjustment

LEATHER RING ELBOW CRUTCH

- ‘Sawed-off’ crutch
- Rivets
- Piece of car tire
- A disadvantage is that if a child falls he may have trouble getting his arms out quickly.

These crutches are easy to make and work well for children who have strong arms and hands.

Design from Poliomyelitis, Huckstep.

from Poliomyelitis, Huckstep.

A disadvantage is that if a child falls he may have trouble getting his arms out quickly.
OTHER ELBOW CRUTCHES

With these open elbow-ring crutches, the child can easily get his arms out if he falls.

**STANDARD ADJUSTABLE**

- Metal band covered by leather or padding
- Joint that allows movement of elbow band
- Thin steel or aluminum tube

**USING LOCAL RESOURCES**

- Thick bamboo
- Bamboo or cane
- Cane wrap
- Design from Philippines
- Piece of bamboo or plastic pipe
  - Or heat and bend any piece of thick plastic

**Gutter crutch** ('arthritis crutch')

For children who, due to elbow pain or stiffness, cannot use straight-arm crutches.

**Crutch** for a child with weak elbow-straightening muscles.

**STANDARD**

- Bamboo or plastic
- Bend ends of branch and bind them together
- Tree branch with forks

**USING LOCAL RESOURCES**

- Crutch top with deep notch
- Padded block
- Loop of leather or soft, strong cloth

These are only examples. Once you get the idea, you can invent your own. A lot of experimentation is often needed to adapt crutches for children with severe arthritis.
Canes and walking sticks

**Straight poles**
can help a child with balance problems.

**CAUTION:** Use poles that are taller than child so if she falls, they will not poke her eyes.

**CANES CUT FROM FOREST PLANTS**

**ADJUSTABLE METAL TUBE CANE**

**3 OR 4 FOOTED CANE—FOR GREATER STABILITY**

**Rubber tip made from car tire**
for metal tube or bamboo crutch or cane

**STANDARD METAL TUBE**

**With a sharp knife or grinder, cut a plug of car tire in this shape.**

**Force it into the tube and fasten it with a screw.**

**For walking in sandy places**
make crutch and cane tips extra wide.

**ALTERNATIVE HAND GRIP**

**Bind base to keep from splitting more.**

**STANDARD CRUTCH AND CANE TIP**

**For the child who needs to strengthen a weak or painful leg, a cane makes him use his leg. A crutch lets him avoid using his leg, so the muscles that bend his leg get stronger, rather than the ones that straighten it.**

(See p. 526.)
