Chapter 22

In this chapter:

Problems with Monthly Bleeding .................................................. 360
  Heavy monthly bleeding ........................................................... 360
  Light monthly bleeding ............................................................. 360
  Monthly bleeding that comes too often,
  or bleeding at other times ....................................................... 361
  When monthly bleedings come too far apart,
  or have stopped ..................................................................... 361

Other Kinds of Bleeding Problems ................................................. 362
  Bleeding during pregnancy or after childbirth ......................... 362
  Bleeding after an abortion or miscarriage ............................... 363
  Bleeding after sex .................................................................... 363
  Bleeding after menopause ......................................................... 363

How to use this chapter:

Most of the causes of the bleeding problems in this chapter are described in
other parts of this book. If you have a bleeding problem, look it up here and then
turn to the numbered page listed for more information. If the problem is not
covered in this book, see a health worker trained to do pelvic exams.
It is normal for monthly bleeding to change from time to time because of illness, stress, pregnancy, breastfeeding, a long journey, overwork, or a change in diet. But if a change in monthly bleeding happens suddenly, lasts more than a few months, or if it comes with other problems, it may be a sign of a more serious problem.

Danger signs

If a woman has any of these danger signs, she may need medical help right away. Turn to the numbered page listed for more information.

- bleeding and pain in the abdomen when regular monthly bleeding has been missed (page 73)
- bleeding in late pregnancy (page 74)
- heavy bleeding after childbirth, miscarriage, or abortion (pages 92, 234, and 251)

➤ If monthly bleeding suddenly changes, always think about the possibility of pregnancy—even if a family planning method is being used.
Abnormal Bleeding from the Vagina

Problems with Monthly Bleeding

HEAVY MONTHLY BLEEDING, OR BLEEDING THAT LASTS A LONG TIME

- Monthly bleeding is heavy if a pad or cloth is soaked through in less than one hour.
- Monthly bleeding is long if it lasts for more than 8 days.
- Blood clots (soft, dark red, shiny lumps in the blood that look like liver) are also a sign of heavy bleeding.
- Heavy bleeding that goes on for many weeks, months or years can cause weak blood (anemia, see page 172).

Causes:

- The hormones may be out of balance so the ovary does not release an egg. This is common for women under 20 and women over 40 years of age (see page 47).
- An intra-uterine device (IUD) may be making monthly bleeding more heavy (see page 216).
- Miscarriage, even if you did not think you were pregnant (see pages 98 and 234).
- If you have pain in the abdomen with bleeding, you may have a pregnancy outside the womb in the tube. URGENT. Go to a hospital right away (see page 73).
- You may have a problem with the thyroid gland.
- You may have growths (fibroids or polyps) or cancer in your womb (see page 380).

IMPORTANT See a health worker trained to do pelvic exams if you have heavy bleeding and:

- blood gushes from your vagina.
- monthly bleeding has been heavy and long for 3 months.
- you think you might be pregnant.
- you have severe pain with the bleeding.

LIGHT MONTHLY BLEEDING

Light bleeding each month is not a health problem.

Causes:

- Some family planning methods—like injections, implants, and the pill—can make you bleed less after you have been using them for some time.
- Your ovaries may not have released an egg.
MONTHLY BLEEDING THAT COMES TOO OFTEN, OR BLEEDING AT OTHER TIMES

Something may be wrong if monthly bleeding comes more often than every 3 weeks, or if it comes and goes without a regular pattern.

Causes:
- The ovary may not have released an egg (see page 48).
- There may be growths (fibroids or polyps) or cancer in the womb, especially if monthly bleeding is heavy and not regular (see page 380).
- Taking the medicine called estrogen after menopause (see page 124).
- Some family planning methods—like the pill, implants, and injections—can cause you to bleed more often (see pages 208, 213, and 214).

WHEN MONTHLY BLEEDINGS COME TOO FAR APART, OR HAVE STOPPED

Monthly bleeding usually comes about every 21 to 35 days. It may be normal to have an even longer time between bleeding. But something may be wrong, or you may be pregnant, if your monthly bleeding does not come at all.

Causes:
- You may be pregnant (see page 67).
- You may be having a miscarriage (see page 98).
- The ovary may not have released an egg (see page 231).
- You may have a serious illness—like malaria, tuberculosis (see page 387) or a worsening HIV infection (see page 283).
- If you are over 40 or 45, you may be nearing menopause (see page 124).
- Some family planning methods—like the pill, injections, and implants—can make monthly bleedings come far apart (see pages 208, 213, and 214).
- Poor nutrition may change monthly bleeding (see page 172).
## Other Kinds of Bleeding Problems

### BLEEDING DURING PREGNANCY OR AFTER CHILDBIRTH

<table>
<thead>
